<center>Project Idea Proposal</center>

Write a short description of your project idea, including sketches if they are helpful.  Write some initial code to get started. Submit a zip file containing your project code and description, and hand in a hard copy of your proposal either in class or under my office door.

The main idea of the project is to design something that interacts with the inventory system I'm working on in Senior Project. While I'm not entirely sure what that will end up looking like, I want it to have some of the same main features. That means it should include the ability to read and update from the database I have. In order to utilize the ability to update the database, I will need a way to display the tables as well as a way to add new rows, edit rows, and delete rows.

I wrote some initial code to get started, but if you'll believe it, Google Docs isn't that great of a code editor. So I switched over to Xcode for the rest:)

- import SwiftUI
- 
- struct TableView: View {
    - var body: some View {
    - }
- }
- 
- struct TableView_Previews: PreviewProvider {
    - static var previews: some View {
        - TableView()
    - }
- }
